BICYCLIC HETEROAROMATIC COMPOUNDS AS PROTEIN TYROSINE KINASE INHIBITORS

The present invention relates to a series of substituted heteroaromatic compounds, methods for their preparation, pharmaceutical compositions containing them and
5 their use in medicine. In particular, the invention relates to quinoline, quinazoline, pyridopyridine and pyridopyrimidine derivatives which exhibit protein tyrosine kinase inhibition.

Protein tyrosine kinases catalyse the phosphorylation of specific tyrosyl residues in
10 various proteins involved in the regulation of cell growth and differentiation (A.F. Wilks, Progress in Growth Factor Research, 1990, 2, 97-111; S.A. Courtneidge, Dev. Supp.I, 1993, 57-64; J.A. Cooper, Semin. Cell Biol., 1994, 5(6), 377-387; R.F. Paulson, Semin. Immunol., 1995, 7(4), 267-277; A.C. Chan, Curr. Opin. Immunol., 1996, 8(3), 394-401). Protein tyrosine kinases can be broadly classified as receptor
15 (e.g. EGFr, c-erbB-2, c-met, tie-2, PDGFr, FGFr) or non-receptor (e.g. c-src, lck, zap70) kinases. Inappropriate or uncontrolled activation of many of these kinase, i.e. aberrant protein tyrosine kinase activity, for example by over-expression or mutation, has been shown to result in uncontrolled cell growth.

20 Aberrant activity of protein tyrosine kinases, such as c-erbB-2, c-src, c-met, EGFr and PDGFr have been implicated in human malignancies. Elevated EGFr activity has, for example, been implicated in non-small cell lung, bladder and head and neck cancers, and increased c-erbB-2 activity in breast, ovarian, gastric and pancreatic cancers. Inhibition of protein tyrosine kinases should therefore provide a treatment
25 for tumours such as those outlined above.

Aberrant protein tyrosine kinase activity has also been implicated in a variety of other disorders: psoriasis, (Dvir et al, J.Cell.Biol; 1991, 113, 857-865), fibrosis, atherosclerosis, restenosis, (Buchdunger et al, Proc.Natl.Acad.Sci. USA; 1991, 92,
30 2258-2262), auto-immune disease, allergy, asthma, transplantation rejection (Klausner and Samelson, Cell; 1991, 64, 875-878), inflammation (Berkois, Blood; 1992, 79(9), 2446-2454), thrombosis (Salari et al, FEBS; 1990, 263(1), 104-108) and nervous system diseases (Ohmichi et al, Biochemistry, 1992, 31, 4034-4039). Inhibitors of the specific protein tyrosine kinases involved in these diseases eg
35 PDGF-R in restenosis and EGF-R in psoriasis, should lead to novel therapies for

such disorders. P56lck and zap 70 are indicated in disease conditions in which T cells are hyperactive e.g. rheumatoid arthritis, autoimmune disease, allergy, asthma and graft rejection. The process of angiogenesis has been associated with a number of disease states (e.g. tumourogenesis, psoriasis, rheumatoid arthritis) and
5 this has been shown to be controlled through the action of a number of receptor tyrosine kinases (L.K. Shawver, DDT, 1997, 2(2), 50-63).

It is therefore a general object of the present invention to provide compounds suitable for the treatment of disorders mediated by protein tyrosine kinase activity,
10 and in particular treatment of the above mentioned disorders.

In addition to the treatment of tumours, the present invention envisages that other disorders mediated by protein tyrosine kinase activity may be treated effectively by inhibition, including preferential inhibition, of the appropriate protein tyrosine kinase
15 activity.

Broad spectrum inhibition of protein tyrosine kinase may not always provide optimal treatment of, for example tumours, and could in certain cases even be detrimental to subjects since protein tyrosine kinases provide an essential role in the normal
20 regulation of cell growth.

It is another object of the present invention to provide compounds which preferentially inhibit protein tyrosine kinases, such as EGFr, c-erbB-2, c-erbB-4, c-met, tie-2, PDGFr, c-src, lck, Zap70, and fyn. There is also perceived to be a benefit
25 in the preferential inhibition involving small groups of protein tyrosine kinases, for example groups including two or more of c-erbB-2, c-erbB-4, EGF-R, lck and zap70.

A further object of the present invention is to provide compounds useful in the treatment of protein tyrosine kinase related diseases which minimise undesirable
30 side-effects in the recipient.

The present invention relates to heterocyclic compounds which may be used to treat disorders mediated by protein tyrosine kinases and in particular have anti-cancer properties. More particularly, the compounds of the present invention are potent
35 inhibitors of protein tyrosine kinases such as such as EGFr, c-erbB-2, c-erbB-4, c-

met, tie-2, PDGFr, c-src, lck, Zap70, and fyn, thereby allowing clinical management of particular diseased tissues.

5 The present invention envisages, in particular, the treatment of human malignancies, for example breast, non-small cell lung, ovary, stomach, and pancreatic tumours, especially those driven by EGF-R or erbB-2, using the compounds of the present invention. For example, the invention includes compounds which are highly active against the c-erbB-2 protein tyrosine kinase often in preference to the EGF receptor kinase hence allowing treatment of c-erbB-2 driven tumours. However, the
10 invention also includes compounds which are highly active against both c-erbB-2 and EGF-R receptor kinases hence allowing treatment of a broader range of tumours.

15 The present invention also includes compounds which are active against lck and/or zap70 receptor kinases; these may also be active against c-erbB-2 and/or EGF-R receptor kinases. The compounds may be selective towards lck and/or zap70 in comparison to c-erbB-2 and/or EGF-R.

20 More particularly, the present invention envisages that disorders mediated by protein tyrosine kinase activity may be treated effectively by inhibition of the appropriate protein tyrosine kinase activity in a relatively selective manner, thereby minimising potential side effects.

25 Accordingly, the present invention provides a compound of formula (I)

Certain compounds of formula (I) may exist in stereoisomeric forms (e.g. they may contain one or more asymmetric carbon atoms or may exhibit *cis-trans* isomerism). The individual stereoisomers (enantiomers and diastereoisomers) and mixtures of
35 these are included within the scope of the present invention. Likewise, it is

understood that compounds of formula (I) may exist in tautomeric forms other than that shown in the formula and these are also included within the scope of the present invention.

- 5 Salts of the compounds of the present invention may comprise acid addition salts derived from a nitrogen in the compound of formula (I). The therapeutic activity resides in the moiety derived from the compound of the invention as defined herein and the identity of the other component is of less importance although for therapeutic and prophylactic purposes it is, preferably, pharmaceutically acceptable
- 10 to the patient. Examples of pharmaceutically acceptable acid addition salts include those derived from mineral acids, such as hydrochloric, hydrobromic, phosphoric, metaphosphoric, nitric and sulphuric acids, and organic acids, such as tartaric, acetic, trifluoroacetic, citric, malic, lactic, fumaric, benzoic, glycolic, gluconic, succinic and methanesulphonic and arylsulphonic, for example p-toluenesulphonic, acids.

15

According to a further aspect of the present invention there is provided a process for the preparation of a compound of formula (I) as defined above which comprises the steps:

(a) the reaction of a compound of formula (II)

20

wherein X is as defined above;

Y' is CL' and V' is N;

25 or Y' is N and V' is CL';

or Y' is CL' and V' is CR²;

or Y' is CR² and V' is CL';

wherein R² is as defined above, and L and L' are suitable leaving groups, with a compound of formula (III)

30

wherein U is as defined above, to prepare a compound of formula (IV)

41

- and subsequently (b) reaction with appropriate reagent(s) to substitute the group R¹ by replacement of the leaving group L'; and, if desired, (c) subsequently converting the compound of formula (I) thereby obtained into another compound of formula (I) by means of appropriate reagents.

- Alternatively, the compound of formula (II) as defined above is reacted with the appropriate reagents to substitute the group R¹ by replacement of the leaving group L' and then the product thereby obtained (of formula (V) below) is reacted with the compound of formula (III) as defined above, followed, if desired, by conversion of the compound of formula (I) thereby obtained into another compound of formula (I).

- In a variant of this alternative the compound of formula (V)

wherein X, Y, V, U and L are as defined above, may be prepared by the reaction of a compound of formula (VI)

20

wherein V' and Y' are as defined above, with appropriate reagents to substitute the group R¹ for the leaving group L' to prepare a compound of formula (VII)

and subsequent reaction to incorporate the leaving group L. For example, a chloro
leaving group can be incorporated by reaction of a corresponding 3,4-
5 dihydropyrimidone with carbon tetrachloride/triphenylphosphine in an appropriate
solvent.

The group R¹ may, therefore, be substituted onto the basic ring system by
replacement of a suitable leaving group. This may, for example, be carried out by
10 reaction of the corresponding aryl or heteroaryl stannane derivative with the
corresponding compound of formula (IV) carrying the leaving group L' in the
appropriate position on the ring.

According to a further aspect of the present invention there is provided a process for
15 the preparation of a compound of formula (I) as defined above which comprises the
steps:

(a) reacting a compound of formula (IV) as defined above with appropriate
reagent(s) to prepare a compound of formula (VIII)

20 wherein X and U are as defined above;

Y'' is CT and V'' is N;

or Y'' is N and V'' is CT;

or Y'' is CT and V'' is CR²;

or Y'' is CR² and V'' is CT; wherein R² is as defined above and T is an appropriately
25 functionalised group;

and (b) subsequently converting the group T into the group R¹ by means of
appropriate reagent(s); and, if desired, (c) subsequently converting the compound of
formula (I) thereby obtained into another compound of formula (I) by means of
appropriate reagents.

In one alternative, the group T would represent a group Ar as defined above carrying a formyl group (CHO).

- 5 Where T represents a group Ar carrying a formyl group the compound (of formula (VIIIa)) may be suitably prepared from the corresponding dioxolanyl substituted compound (of formula (VIIIb)), for example by acid hydrolysis. The dioxolanyl substituted compound may be prepared by reaction of a compound of formula (IV) with an appropriate reagent to substitute the relevant leaving group with the
10 substituent carrying the dioxolanyl ring. This reagent could, for example, be an appropriate heteroaryl stannane derivative.

- Therefore a suitable process may comprise reaction of a compound of formula (VIIIa) in which T is a group Ar carrying a formyl substituent (i.e. a -CHO group) with
15 a compound of formula $\text{CH}_3\text{SO}_2\text{CH}_2\text{CH}_2\text{NH}_2$. The reaction preferably involves a reductive amination by means of an appropriate reducing agent, for example sodium triacetoxyborohydride.

- Alternatively, another suitable process may comprise oxidation of a compound of formula (VIIIc) in which T is a group Ar carrying a substituent of formula
20 $\text{CH}_3\text{SCH}_2\text{CH}_2\text{NHCH}_2$ or $\text{CH}_3\text{SOCH}_2\text{CH}_2\text{NHCH}_2$. Suitable methods for the oxidation to the desired compound of formula (I) will be well known to the person skilled in the art but include, for example, reaction with an organic peroxide, such as peracetic acid or metachlorobenzoic acid, or reaction with an inorganic oxidising agent, such as
25 OXONE®. The compound of formula (VIIIc) in which T is a group Ar carrying a substituent of formula $\text{CH}_3\text{SCH}_2\text{CH}_2\text{NHCH}_2$ or $\text{CH}_3\text{SOCH}_2\text{CH}_2\text{NHCH}_2$ may be prepared by an analogous reaction to that described above, namely reaction of a compound of formula (VIIIa) in which T is a group Ar carrying a formyl substituent (i.e. a -CHO group) with a compound of formula $\text{CH}_3\text{SCH}_2\text{CH}_2\text{NH}_2$ or
30 $\text{CH}_3\text{SOCH}_2\text{CH}_2\text{NH}_2$ respectively.

Alternatively, an analogous scheme to those described above could be used wherein the substitution of the group R^1 onto the basic ring system occurs prior to the coupling reaction with the compound of formula (III).

According to a further alternative process the group T is converted into the group R¹ by a *de novo* synthesis of a substituted heterocyclic system using appropriate agents. Such a process would involve standard synthetic methodology known to the person skilled in the art for building up the heterocyclic ring system.

5

For example, T could represent a haloketone group as shown in the compound of formula (IX) in scheme 1 below which, when coupled with an appropriate N-protected thioamide [compound of formula (XI) in scheme 2], would result in the formation of an N-protected amino-substituted thiazole system of formula (X).

10

Scheme 1 outlines, for example, the synthesis of derivatives carrying a substituted thiazole ring as an R¹ substituent:

45

Scheme 1

wherein halo is as previously defined (preferably iodo), and P' in the compound of
 5 formula (XI) is a suitable protecting group, such as trifluorocarbonyl.

An analogous process may be used to prepare compounds of formula(I) which carry
 R' in the 7-position of the basic ring system from a starting compound of
 formula(IVb)

via intermediates of formulae (Xb) and (Xlb) which are respectively analogous to those of formulae (Xa) and (Xlb).

- 5 An appropriately substituted thioamide coupling reagent, suitable for preparation of a thiazole ring system, may be prepared according to Scheme 2:

10

Scheme 2

Wherein in scheme 2 the trifluorocarbonyl protecting group in the compounds of formula (XIV), (XV) and (XVIa) is equivalent to the group P' in scheme 1.

15

Alternatively, an analogous scheme to those described above could be used wherein the substitution of the group R¹ onto the basic ring system occurs prior to the coupling reaction with the compound of formula (III).

Other substituted thioamides are prepared using analogous processes to that shown above.

5 In general, the group R^2 will be present as a substituent in the basic ring system prior to the introduction of the group R^1 or the group NHU. Where R^2 is other than hydrogen it may in certain circumstances be necessary to protect the group prior to performing the reaction steps to introduce the R^1 and NHU substituents. Particular
10 mention should be made of the situation where R^2 is hydroxy; suitable protecting groups to ensure non-interference with the subsequent reaction steps include the 2-methoxyethoxymethyl ether (MEM) group or a bulky silyl protecting group such as tert-butyldiphenylsilyl (TBDPS).

Suitable protecting groups, methods for their introduction and methods for their removal would be well known to the person skilled in the art. For a description of
15 protecting groups and their use see T.W. Greene and P.G.M. Wuts, "Protective Groups in Organic Synthesis", 2nd edn., John Wiley & Sons, New York, 1991.

Suitable leaving groups for L and L' will be well known to those skilled in the art and include, for example, halo such as fluoro, chloro, bromo and iodo; sulphonyloxy
20 groups such as methanesulphonyloxy and toluene-p-sulphonyloxy; alkoxy groups; and triflate.

The coupling reaction referred to above with the compound of formula (III) is conveniently carried out in the presence of a suitable inert solvent, for example a
25 C_{1-4} alkanol, such as isopropanol, a halogenated hydrocarbon, an ether, an aromatic hydrocarbon or a dipolar aprotic solvent such as acetone, acetonitrile or DMSO at a non-extreme temperature, for example from 0 to 150°C, suitably 10 to 120°C, preferably 50 to 100°C.

30 Optionally, the reaction is carried out in the presence of a base. Examples of suitable bases include an organic amine such as triethylamine, or an alkaline earth metal carbonate, hydride or hydroxide, such as sodium or potassium carbonate, hydride or hydroxide.

The compound of formula (I) may be obtained from this process in the form of a salt with the acid HL, wherein L is as hereinbefore defined, or as the free base by treating the salt with a base as hereinbefore defined.

- 5 The compounds of formulae (II) and (III) as defined above, the reagents to substitute the group R¹, and the reagent(s) to convert the group T into the group R¹ are either readily available or can be readily synthesised by those skilled in the art using conventional methods of organic synthesis.
- 10 As indicated above, the compound of formula (I) prepared may be converted to another compound of formula (I) by chemical transformation of the appropriate substituent or substituents using appropriate chemical methods (see for example, J. March "Advanced Organic Chemistry", Edition III, Wiley Interscience, 1985).
- 15 For example, a compound containing an alkylthio group may be oxidised to the corresponding sulphonyl or sulphonyl compound by use of an organic peroxide (e.g. benzoyl peroxide) or suitable inorganic oxidant (eg OXONE ®).
- 20 A compound containing a nitro substituent may be reduced to the corresponding amino-compound, e.g. by use of hydrogen and an appropriate catalyst (if there are no other susceptible groups), by use of Raney Nickel and hydrazine hydrate or by use of iron/acetic acid.
- 25 Amino substituents may be acylated by use of an acid chloride or an anhydride under appropriate conditions. Equally an amide group may be cleaved to the amino compound by treatment with, for example, dilute aqueous base.
- 30 An amino substituent may also be converted to a dimethylamino substituent by reaction with formic acid and sodium cyanoborohydride. Similarly, reaction of a primary or secondary amino group with another suitable aldehyde under reducing conditions will lead to the corresponding substituted amine.
- 35 All of the above-mentioned chemical transformations may also be used to convert any relevant intermediate compound to another intermediate compound prior to the final reaction to prepare a compound of formula (I); this would thus include their use

to convert one compound of formula (III) to a further compound of formula (III) prior to any subsequent reaction.

5 Various intermediate compounds used in the above-mentioned processes, including but not limited to certain of the compounds of formulae (II), (III), (IV), (V), (VI), (VII) and (VIII) as illustrated above, are novel and thus represent a further aspect of the present invention.

10 In particular, a further aspect of the present invention is intermediate compounds of formulae (VIIIa) and (VIIIb) defined above, with the exception of the following compounds:

(1-Benzyl-1H-indazol-5-yl)-(6-(5-[1,3-dioxolan-2-yl]-furan-2-yl)-pyrido[3,4-d]pyrimidin-4-yl)-amine;
5-(4-(1-Benzyl-1H-indazol-5-ylamino)-pyrido[3,4-d]pyrimidin-6-yl)-furan-2-carbaldehyde;
15 5-(4-(4-Benzyloxy-phenylamino)-pyrido[3,4-d]pyrimidin-6-yl)-furan-2-carbaldehyde;
(4-Benzyloxy-phenyl)-(6-(5-[1,3-dioxolan-2-yl]-furan-2-yl)-quinazolin-4-yl)-amine;

(1-Benzyl-1H-indazol-5-yl)-(6-(5-[1,3-dioxolan-2-yl]-furan-2-yl)-quinazolin-4-yl)-
20 amine;
5-(4-(1-Benzyl-1H-indazol-5-ylamino)-quinazolin-6-yl)-furan-2-carbaldehyde;
5-(4-(1-Benzyl-1H-indazol-5-ylamino)-quinazolin-6-yl)-1-methyl-pyrrole-2-carbaldehyde;
(1-Benzyl-1H-indazol-5-yl)-(7-(5-[1,3-dioxolan-2-yl]-furan-2-yl)-quinazolin-4-yl)-
25 amine;
5-(4-(1-Benzyl-1H-indazol-5-ylamino)-quinazolin-7-yl)-furan-2-carbaldehyde.

In particular, a yet further aspect of the present invention is intermediate compounds of formula (VIIIc) as defined above;
30 with the proviso that the following compound is excluded:
(4-Benzyloxy-phenyl)-(6-(5-((2-methanesulphanyl-ethylamino)-methyl)-furan-2-yl)-pyrido[3,4-d]pyrimidin-4-yl)-amine.

In particular, another further aspect of the present invention is intermediate
35 compounds of formulae (X), (XI), (XII), (XIII), (XIV), (XV) and (XVI) as defined above.

The compounds of formula (I) and salts thereof have anticancer activity as demonstrated hereinafter by their inhibition of the protein tyrosine kinase c-erbB-2, c-erbB-4 and/or EGF-R enzymes and their effect on selected cell lines whose growth
5 is dependent on c-erbB-2 or EGF-r tyrosine kinase activity. Certain compounds of formula (I) are also demonstrated hereinafter to inhibit lck and/or zap70 protein tyrosine kinase enzymes and are expected to have activity in disease conditions in which T cells are hyperactive.

10 The present invention thus also provides compounds of formula (I) and pharmaceutically acceptable salts or solvates thereof for use in medical therapy, and particularly in the treatment of disorders mediated by aberrant protein tyrosine kinase activity such as human malignancies and the other disorders mentioned above. The compounds of the present invention are especially useful for the
15 treatment of disorders caused by aberrant c-erbB-2 and/or EGF-r and/or lck activity such as breast, ovarian, gastric, pancreatic, non-small cell lung, bladder, head and neck cancers, psoriasis and rheumatoid arthritis.

A further aspect of the invention provides a method of treatment of a human or
20 animal subject suffering from a disorder mediated by aberrant protein tyrosine kinase activity, including susceptible malignancies, which comprises administering to said subject an effective amount of a compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof.

25 A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in therapy.

A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in the preparation of a
30 medicament for the treatment of cancer and malignant tumours.

A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in the preparation of a
35 medicament for the treatment of psoriasis.

A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in the preparation of a medicament for the treatment of rheumatoid arthritis.

- 5 Whilst it is possible for the compounds, salts or solvates of the present invention to be administered as the new chemical, it is preferred to present them in the form of a pharmaceutical formulation.

- According to a further feature of the present invention there is provided a
10 pharmaceutical formulation comprising at least one compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, together with one or more pharmaceutically acceptable carriers, diluents or excipients.

- Pharmaceutical formulations may be presented in unit dose forms containing a
15 predetermined amount of active ingredient per unit dose. Such a unit may contain for example 0.5mg to 1g, preferably 70mg to 700mg, more preferably 5mg to 100mg of a compound of the formula (I) depending on the condition being treated, the route of administration and the age, weight and condition of the patient.

- 20 Pharmaceutical formulations may be adapted for administration by any appropriate route, for example by the oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual or transdermal), vaginal or parenteral (including subcutaneous, intramuscular, intravenous or intradermal) route. Such formulations may be prepared by any method known in the art of pharmacy, for example by
25 bringing into association the active ingredient with the carrier(s) or excipient(s).

- Pharmaceutical formulations adapted for oral administration may be presented as discrete units such as capsules or tablets; powders or granules; solutions or
30 suspensions in aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil liquid emulsions.

Pharmaceutical formulations adapted for transdermal administration may be presented as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. For example, the active

ingredient may be delivered from the patch by iontophoresis as generally described in Pharmaceutical Research, 3(6), 318 (1986).

5 Pharmaceutical formulations adapted for topical administration may be formulated as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols or oils.

10 For treatments of the eye or other external tissues, for example mouth and skin, the formulations are preferably applied as a topical ointment or cream. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water cream base or a water-in-oil base.

15 Pharmaceutical formulations adapted for topical administrations to the eye include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent.

20 Pharmaceutical formulations adapted for topical administration in the mouth include lozenges, pastilles and mouth washes.

Pharmaceutical formulations adapted for rectal administration may be presented as suppositories or as enemas.

25 Pharmaceutical formulations adapted for nasal administration wherein the carrier is a solid include a coarse powder having a particle size for example in the range 20 to 500 microns which is administered in the manner in which snuff is taken, i.e. by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid, for administration as a nasal spray or as nasal drops, include aqueous or oil solutions of the active
30 ingredient.

Pharmaceutical formulations adapted for administration by inhalation include fine particle dusts or mists which may be generated by means of various types of metered dose pressurised aerosols, nebulizers or insufflators.

35

Pharmaceutical formulations adapted for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations.

- Pharmaceutical formulations adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets.
- Preferred unit dosage formulations are those containing a daily dose or sub-dose, as herein above recited, or an appropriate fraction thereof, of an active ingredient.

- It should be understood that in addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

- The animal requiring treatment with a compound, salt or solvate of the present invention is usually a mammal, such as a human being.

- A therapeutically effective amount of a compound, salt or solvate of the present invention will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration, and will ultimately be at the discretion of the attendant physician or veterinarian. However, an effective amount of a compound of the present invention for the treatment of neoplastic growth, for example colon or breast carcinoma, will generally be in the range of 0.1 to 100 mg/kg body weight of recipient (mammal) per day and more usually in the range of 1 to 10 mg/kg body weight per day. Thus, for a 70kg adult mammal, the actual amount per day would usually be from 70 to 700 mg and this amount may be

given in a single dose per day or more usually in a number (such as two, three, four, five or six) of sub-doses per day such that the total daily dose is the same. An effective amount of a salt or solvate of the present invention may be determined as a proportion of the effective amount of the compound per se. It is envisaged that
5 similar dosages would be appropriate for treatment of the other conditions referred to above.

The compounds of the present invention and their salts and solvates may be employed alone or in combination with other therapeutic agents for the treatment of
10 the above-mentioned conditions. In particular, in anti-cancer therapy, combination with other chemotherapeutic, hormonal or antibody agents is envisaged. Combination therapies according to the present invention thus comprise the administration of at least one compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof and at least one other pharmaceutically active
15 agent. The compound(s) of formula (I) and the other pharmaceutically active agent(s) may be administered together or separately and, when administered separately this may occur simultaneously or sequentially in any order. The amounts of the compound(s) of formula (I) and the other pharmaceutically active agent(s) and the relative timings of administration will be selected in order to achieve the
20 desired combined therapeutic effect.

Certain embodiments of the present invention will now be illustrated by way of example only. The physical data given for the compounds exemplified is consistent with the assigned structure of those compounds.

Useful preparative techniques are described in WO96/09294, WO97/03069, WO97/13771, WO95/19774, WO96/40142 and WO97/30034; also described in these publications are appropriate intermediate compounds other than those detailed below.

15

Preparation processes specified in the prior art or in the experimental details below for compounds with a particular basic ring system (1) to (6) above may be suitably adapted for others of these basic ring systems.

20

General Procedures

(A) Reaction of an amine with a bicyclic species containing a 4-chloropyrimidine or 4-chloropyridine ring

25 The optionally substituted bicyclic species and the specified amine were mixed in an appropriate solvent (typically acetonitrile unless otherwise specified, although ethanol, 2-propanol or DMSO may also be used), and heated to reflux. When the reaction was complete (as judged by tlc), the reaction mixture was allowed to cool. The resulting suspension was diluted, *e.g.* with acetone, and the solid collected by filtration, washing *e.g.* with excess acetone, and dried at 60°C *in vacuo*, giving the product as the hydrochloride salt. If the free base was required.
30 (*e.g.* for further reaction), this was obtained by treatment with a base *e.g.* triethylamine; purification by chromatography was then performed if required.

(B) Reaction of a product from Procedure (A) with a heteroaryl tin reagent

A stirred mixture of the product from Procedure (A), (containing a suitable leaving group such as chloro, bromo, iodo or triflate), a heteroaryl stannane and a suitable palladium catalyst, such as bis(triphenylphosphine)palladium (II) chloride or 1,4-bis(diphenylphosphino)butane palladium (II) chloride (prepared as described in C.E. Housecroft et. al., Inorg. Chem., (1991), 30(1), 125-130), together with other appropriate additives (such as diisopropylethylamine or lithium chloride), were heated at reflux in dry dioxane or another suitable solvent (e.g. DMF) under nitrogen until the reaction was complete. The resulting mixture was generally purified by chromatography on silica.

(C) Removal of a 1,3-dioxolan-2-yl protecting group to liberate an aldehyde

The compound containing the 1,3-dioxolan-2-yl group was suspended in an appropriate solvent, e.g. THF and treated with hydrochloric acid, either as an aqueous solution (e.g. 2N) or as a solution in dioxane (e.g. 4 molar) and stirred at ambient temperature until the reaction was judged complete (e.g. by tlc or LC/MS analysis). Generally the mixture was diluted with water, and the resulting precipitate was collected by filtration, washed with water and dried to give the aldehyde.

(D) Reaction of an aldehyde with an amine by reductive amination

An aldehyde (such as the product of General Procedure C) and the required primary or secondary amine were stirred together in a suitable solvent (such as dichloromethane) containing glacial acetic acid (4A molecular sieves may also be present) for ca. 1h. A suitable reducing agent, such as sodium (triacetoxy) borohydride was then added and stirring continued under nitrogen until the reaction was complete (as judged by hplc or tlc). The resulting mixture was washed with an aqueous basic solution (e.g. sodium or potassium carbonate) and extracted with a suitable solvent, e.g. dichloromethane. The dried organic phase was evaporated and the residue purified either by column chromatography or by Bond Elut™ cartridge. If desired, the isolated material was then converted into the hydrochloride salt e.g. by treatment with ethereal hydrogen chloride.

(E) Reaction sequence to prepare appropriately substituted thioamides

E-1 Reaction of an aminosulfide with chloroacetonitrile

To a stirred mixture of an aminosulfide and a suitable base such as sodium bicarbonate or sodium carbonate in an appropriate solvent (typically acetonitrile, although DMF or dioxane can be used) was added chloroacetonitrile dropwise. The resulting mixture was heated to reflux until the reaction was complete. The solid was filtered and the filtrate was concentrated to provide the corresponding aminonitrile.

E-2 Trifluoroacetamide protection of an aminonitrile

A solution of the aminonitrile (such as the product of general procedure A) and an amine base, such as triethylamine or NMM in a suitable solvent (e.g. dichloromethane), was cooled to 0°C and trifluoroacetic anhydride was added dropwise. The resulting mixture was stirred at room temperature until the reaction was complete. Water was added and the mixture was extracted with a suitable solvent (e.g. dichloromethane), the organic layer was dried over anhydrous magnesium sulfate and concentrated. The crude product was purified by column chromatography to provide the corresponding trifluoroacetamide.

E-3 Oxidation of a cyanosulfide

To a stirred solution of a sulfide (such as the product of general procedure E1) in a suitable solvent (typically methanol/water (2:1), although dichloromethane can be used) cooled to 0°C was added an oxidizing agent (typically oxone, although MCPBA can be used). The resulting mixture was stirred at room temperature until the reaction was complete. The reaction was concentrated to remove any organic solvents, diluted with water, and extracted with an appropriate solvent (e.g. dichloromethane). The organic layer was dried and concentrated to provide the corresponding cyanosulfone.

E-4 Preparation of thioamides

To a solution of a cyanosulfone (such as the product of general procedure E-3) and an organic base (e.g. triethylamine) in THF was added hydrogen sulfide gas. The resulting mixture was stirred at room temperature until the reaction was complete. The mixture was concentrated and triturated with hexane to provide thioamide.

(F) Reaction sequence to prepare an optionally substituted thiazole

F-1 Reaction of a vinylstannane with a product from Procedure (A)

A stirred mixture of the optionally substituted bicyclic 4-anilinopyrimidine species, tributyl(1-ethoxyvinyl)stannane (1 to 5 molar equivalents), and a suitable
5 palladium catalyst (0.03 to 0.1 molar equivalents), such as bis(triphenylphosphine) palladium (II) chloride or tetrakis(triphenylphosphine) palladium (0) was heated at reflux in an appropriate solvent (typically acetonitrile, although DMF or dioxane can be used) until the reaction was complete. The
10 resulting mixture was concentrated and generally purified by trituration with diethyl ether to provide the corresponding bicyclic pyrimidine vinyl ether.

F-2 Reaction of a product from Procedure (F-1) with a bromination reagent

A bicyclic pyrimidine vinyl ether (such as the product of general procedure F-1) and 1 equivalent of a bromination reagent, such as N-bromosuccinimide or bromine,
15 were stirred at 0°C in a suitable solvent (typically 10% aqueous THF or dichloromethane) until the reaction was complete. The resulting mixture was dried over anhydrous magnesium sulfate and concentrated, or in the case of bromine the solid was filtered, to provide the corresponding α -bromoketone.

20 F-3 Reaction of a product from procedure (F-2) with a product from Procedure (E-4)

A stirred mixture of an α -bromoketone (such as the product of general procedure F-2) and thioamide from Procedure E-4 in a 1:1 molar ratio was heated to 70-100°C in an appropriate solvent (typically DMF, although acetonitrile and THF can be used) until the reaction was complete. The resulting mixture was washed with an aqueous
25 basic solution (e.g. sodium carbonate) and extracted with a suitable solvent, e.g. ethyl acetate. The dried organic layer was concentrated and the residue was purified by column chromatography to provide the corresponding trifluoroacetamide aminothiazole.

30 F-4 Removal of a trifluoroacetamide protecting group to liberate an aminothiazole

A mixture of a trifluoroacetamide protected aminothiazole (such as the product of general procedure F-3) in 2M NaOH/methanol (1:1) was stirred at room temperature until the reaction was complete. The mixture was concentrated, poured into water and extracted with an appropriate solvent e.g. 10% MeOH/dichloromethane. The
35 dried organic layer was concentrated, then dissolved in ethyl acetate/MeOH (1:1)

and treated with 4M HCl/dioxane. The resulting solid was filtered to provide the corresponding amine hydrochloride salt.

Synthesis of Intermediates

A stirred solution of 6-chloronicotinic acid (47.3g), diphenylphosphoryl azide (89.6g) and triethylamine (46ml) in t-butanol (240ml) were heated under reflux under nitrogen for 2.5 hours. The solution was cooled and concentrated *in vacuo*. The syrupy residue was poured into 3 litres of a rapidly stirred solution of
10 0.33N aqueous sodium carbonate. The precipitate was stirred for one hour and filtered. The solid was washed with water and dried *in vacuo* at 70°C to give the title compound (62g) as a pale brown solid; m.p. 144-146°C; δ H [2H₆]-DMSO 8.25(1H,d), 7.95 (1H, bd), 7.25 (1H, d), 6.65(1H, bs), 1.51 (9H,s); m/z (M + 1)⁺ 229.

The relevant nitro-substituted 1H-indazole was treated with a base such as potassium carbonate or sodium hydroxide in a suitable solvent, such as acetone or acetonitrile. - 30 1-Benzenesulphonylindol-5-yl-amine was prepared according to the published method (J. Org. Chem., 55, 1379-90, (1990)).

4-Benzyloxyaniline is commercially available as the hydrochloride salt; this is treated with aqueous sodium carbonate solution, and the mixture extracted with ethyl

acetate; the organic solution is dried (MgSO_4) and concentrated to give the free base as a brown solid, used without further purification.

Other substituted anilines were in general prepared by analogous methods to those outlined in WO 96/09294 and/or as follows:

Step 1: Preparation of the precursor nitro-compounds

4-Nitrophenol (or an appropriate substituted analogue, such as 3-chloro-4-nitrophenol) was treated with a base such as potassium carbonate or sodium hydroxide in an appropriate solvent, such as acetone or acetonitrile. The appropriate aryl or heteroaryl halide was added and the reaction mixture heated or stirred at room temperature overnight.

Purification A: Most of the acetonitrile was removed *in vacuo*, and the residue was partitioned between water and dichloromethane. The aqueous layer was extracted with further dichloromethane (x 2), and the combined dichloromethane layers were concentrated *in vacuo*.

Purification B: removal of insoluble material by filtration, followed by concentration of the reaction mixture *in vacuo*, and chromatography on silica.

Step 2: Reduction to the corresponding aniline

The precursor nitro compound was reduced by catalytic hydrogenation at atmospheric pressure using 5% Pt/carbon, in a suitable solvent (eg ethanol, THF, or mixtures thereof to promote solubility). When reduction was complete, the mixture was filtered through Harborlite™, washing with excess solvent, and the resulting solution concentrated *in vacuo* to give the desired aniline. In some cases, the anilines were acidified with HCl (e.g. in a solution in dioxane) to give the corresponding hydrochloride salt.

Biological Data

Compounds of the present invention were tested for protein tyrosine kinase inhibitory activity in substrate phosphorylation assays and cell proliferation assays.

Substrate Phosphorylation Assay

The substrate phosphorylation assays use baculovirus expressed, recombinant constructs of the intracellular domains of c-erbB-2 and c-erbB-4 that are constitutively active and EGFR isolated from solubilised A431 cell membranes. The method measures the ability of the isolated enzymes to catalyse the transfer of the g-phosphate from ATP onto tyrosine residues in a biotinylated synthetic peptide (Biotin-GluGluGluGluTyrPheGluLeuVal). Substrate phosphorylation was detected following either of the following two procedures: a.) c-ErbB-2, c-ErbB4 or EGFR were

incubated for 30 minutes, at room temperature, with 10mM MnCl₂, 10mM ATP, 5 mM peptide, and test compound (diluted from a 5mM stock in DMSO, final DMSO concentration is 2%) in 40mM HEPES buffer, pH 7.4. The reaction was stopped by the addition of EDTA (final concentration 0.15mM) and a sample was transferred to a streptavidin-coated 96-well plate. The plate was washed and the level of phosphotyrosine on the peptide was determined using a Europium-labelled antiphosphotyrosine antibody and quantified with a time-resolved fluorescence technique. b.) ErbB2 was incubated for 50 minutes at room temperature with 15 mM MnCl₂, 2 mM ATP, 0.25 mCi [γ -³³P] ATP/well, 5 mM peptide substrate, and test compound (diluted from a 10mM stock in DMSO, final DMSO concentration is 2%) in 50 mM MOPS pH 7.2. The reaction was terminated by the addition of 200 μ l of PBS containing 2.5 mg/ml streptavidin-coated SPA beads (Amersham Inc.), 50 mM ATP, 10 mM EDTA and 0.1%TX-100. The microtitre plates were sealed and SPA beads were allowed to settle for at least six hours. The SPA signal was measured using a Packard Topcount 96-well plate scintillation counter (Packard Instrument Co., Meriden, CT).

The results are shown in Tables 1A (examples 1 to 7) and 1B (examples 8 to 29 and 33 to 37) as the IC₅₀ values.

Compounds of the present invention were tested for lck and ZAP-70 inhibitory activity in substrate phosphorylation assays.

Lck and ZAP-70 enzymes are both expressed in Sf-9 insect cells. Lysates were prepared and the 100 000g supernatants were stored at -80°C . Lck was assayed in Hepes buffer (pH 7.4) containing ATP (50 μM), MgCl_2 (10mM) and Biotin-EEEEYFELV (200nM). ZAP-70 was assayed in Hepes buffer (pH 7.4) containing ATP (5uM), MgCl_2 (10mM) and Biotin-EELQDDYEDMMEENL (200nM). The reaction was stopped by the addition of EDTA (final concentration 25mM) and samples transferred to streptavidin coated microtitre 96-well plates. Following binding and washing the level of phosphotyrosine peptide was determined using a Europium-labelled (chelate) antiphosphotyrosine antibody. The plate was washed and enhancement solution (Wallac, DELFIA reagent) was added and the level of phosphotyrosine quantified using a time-resolved fluorescence technique. The results are shown in Table 1C as the IC_{50} values.

Cellular assays: Methylene Blue Growth Inhibition Assay

Human breast (BT474), head and neck (HN5) and gastric tumor (N87) cell lines were cultured in low glucose DMEM (Life Technologies 12320-032) containing 10% fetal bovine serum (FBS) at 37°C in a humidified 10% CO₂, 90% air incubator. The SV40 transformed human mammary epithelial cell line HB4a was transfected with either human H-ras cDNA (HB4a r4.2) or the human c-erbB2 cDNA (HB4a c5.2). The HB4a clones were cultured in RPMI containing 10% FBS, insulin (5 µg/ml), hydrocortisone (5 µg/ml), supplemented with the selection agent hygromycin B (50 µg/ml). Cells were harvested using trypsin/EDTA, counted using a haemocytometer, and plated in 100 µl of the appropriate media, at the following densities, in a 96-well tissue culture plate (Falcon 3075): BT474 10,000 cells/well, HN5 3,000 cells/well, N87 10,000 cells/well, HB4a c5.2 3,000 cells/well, HB4a r4.2 3,000 cells/well. The next day, compounds were diluted in DMEM containing 100 mg/ml gentamicin, at twice the final required concentration, from 10mM stock solutions in DMSO. 100µl/well of these dilutions were added to the 100µl of media currently on the cell plates. Medium containing 0.6% DMSO was added to control wells. Compounds diluted in DMEM were added to all cell lines, including the HB4a r4.2 and HB4a c5.2 cell lines. The final concentration of DMSO in all wells was 0.3%. Cells were incubated at 37°C, 10% CO₂ for 3 days. Medium was removed by aspiration. Cell biomass was estimated by staining cells with 100µl per well methylene blue (Sigma M9140, 0.5% in 50:50 ethanol:water), and incubation at room temperature for at least 30 minutes. Stain was removed, and the plates rinsed under a gentle stream of water, and air-dried. To release stain from the cells 100µl of solubilization solution was added (1% N-lauroyl sarcosine, Sodium salt, Sigma L5125, in PBS), and plates were shaken gently for about 30 minutes. Optical density at 620 nm was measured on a microplate reader. Percent inhibition of cell growth was calculated relative to vehicle treated control wells. Concentration of compound that inhibits 50% of cell growth (IC₅₀) was interpolated using nonlinear regression (Levenberg-Marquardt) and the equation, $y = V_{max} * (1 - (x / (K + x))) + Y2$, where "K" was equal to the IC₅₀.

Table 2 illustrates the inhibitory activity of compounds of the present invention as IC₅₀ values in µM against a range of tumor cell lines.

Major Metabolites:

Liver S-9 homogenates (5 mg/mL protein concentration) from prepared pooled male Sprague Dawley rat livers and pooled human livers (XenoTech, LLC, Kansas City, KS) were incubated in 96-well polypropylene plates with representative examples selected from examples 1 to 40 (10 μ M) in a total volume of 0.5 mL. Stock solutions of these compounds were prepared in DMSO at a concentration of 1 mM to maintain a <1% final DMSO concentration for each reaction. Enzymatic incubations contained cofactors (5.71 mM NADPH, 7.14 mM glucose-6-phosphate, 7.14 mM UDPGA, 47.1mM potassium chloride, and 11.4 mM magnesium chloride in 0.1 M potassium phosphate buffer, pH 7.4). Control samples were aspirated from the reaction samples at time zero and placed immediately into 2 volumes of ice-chilled acetonitrile. Sample reaction plates were incubated for 60 min in a shaker incubator maintained at 37°C supplied with O₂. Reactions were terminated by addition of 2 volumes of ice-chilled acetonitrile. All samples were vortexed and centrifuged at 2000 x g for 10 min. The supernatant was removed and analyzed by LC-MS. The metabolite identification work was done by using reversed-phase HPLC coupled with ion-trap mass spectroscopy.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 19 to 26
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 19 to 26
are directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
